

# Systems Verification

## Exercise Sheet 01

### Exercise 1: Installing Spin and iSpin

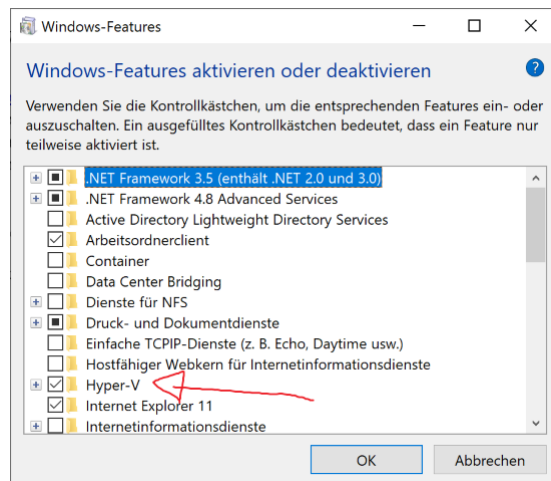

Install a running version of *Spin* and *iSpin* on your computer.

1. When using Windows, follow this guide to *Run Linux GUI apps on the Windows Subsystem for Linux* <https://learn.microsoft.com/en-us/windows/wsl/tutorials/gui-apps>.

You'll require a fairly recent version of Windows 10 (or 11) for this to work and might have to enable Hyper-V (only if the option appears in the Windows Features tool as seen in screenshot below).

**Protip #1:** If you get some weird error, rebooting your system might do the trick.

**Protip #2:** On Ubuntu WSL the Windows filesystem can be accessed through the mount `/mnt/c/`.

2. Install SPIN and related software. On Ubuntu (WSL) you can do this by running:  

```
sudo apt update && sudo apt install spin tcl tk build-essential -y.
```
3. Get the file `ispintcl` from <https://github.com/nimble-code/Spin.git> you can find it in the folder `optional_gui`.
  - Either clone the entire repo by running `git clone https://github.com/nimble-code/Spin.git`.
  - or download the single file `wget https://raw.githubusercontent.com/nimble-code/Spin/master/optional_gui/ispin.tcl` and make it executable `chmod +x ispin.tcl`.
4. Start *iSpin* by running `./path/to/ispin.tcl`.

**Deadline:** Tuesday 1<sup>st</sup> April 2025, 8:00 a.m.
